CLIENT-FACING PRESENTATION

PHONX AI

Real-time voice automation for insurance and other call-heavy operations

Krish Shah role: AI Product Engineer & Head of Dev

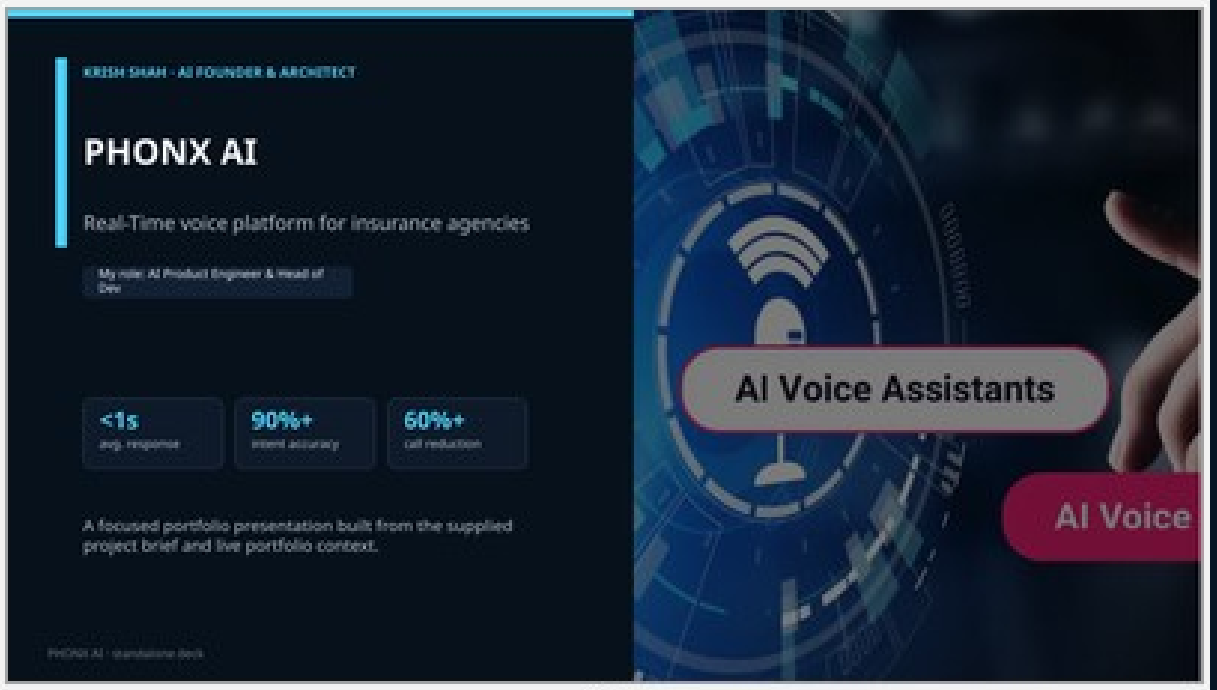

Voice AI platform that answers, qualifies, schedules, and syncs directly into business workflows.

<1s
avg response

90%+
intent accuracy

60%+
call reduction

Framed to help a client understand business value quickly and then go one layer deeper into fit, delivery, and implementation.

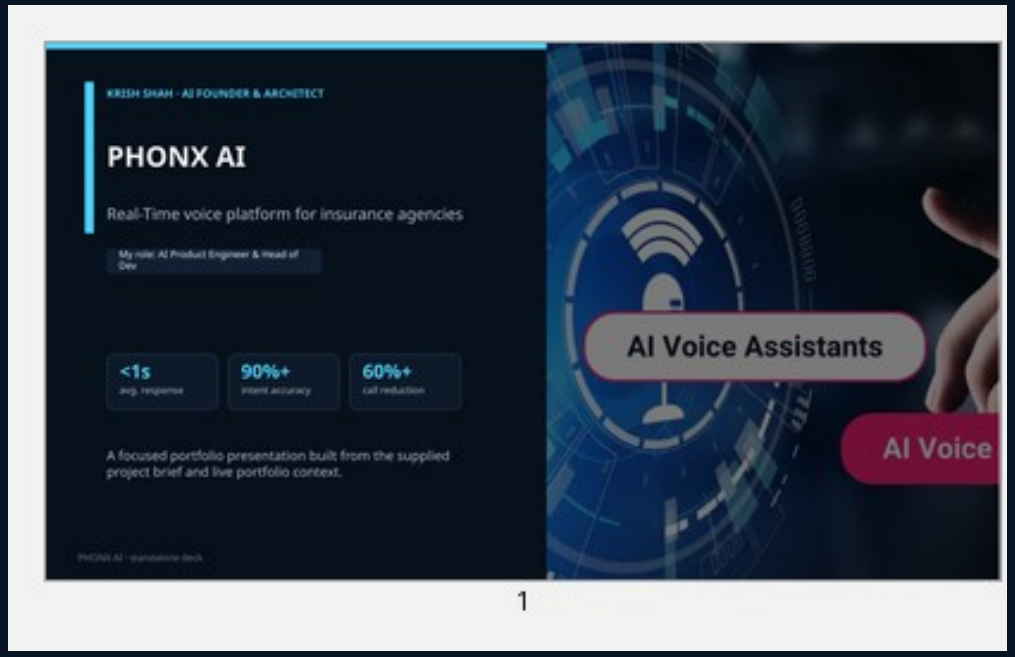

1

THE CLIENT PROBLEM

Why this matters

- High inbound call load creates staffing pressure and missed opportunities.
- Legacy IVR handles routing, not real conversations or compliance-safe answers.
- As volume grows, quality drops unless headcount grows with it.

1

Best fit

Best fit for insurance agencies, appointment-driven teams, support centers, and sales ops where phone responsiveness directly affects conversion or service quality.

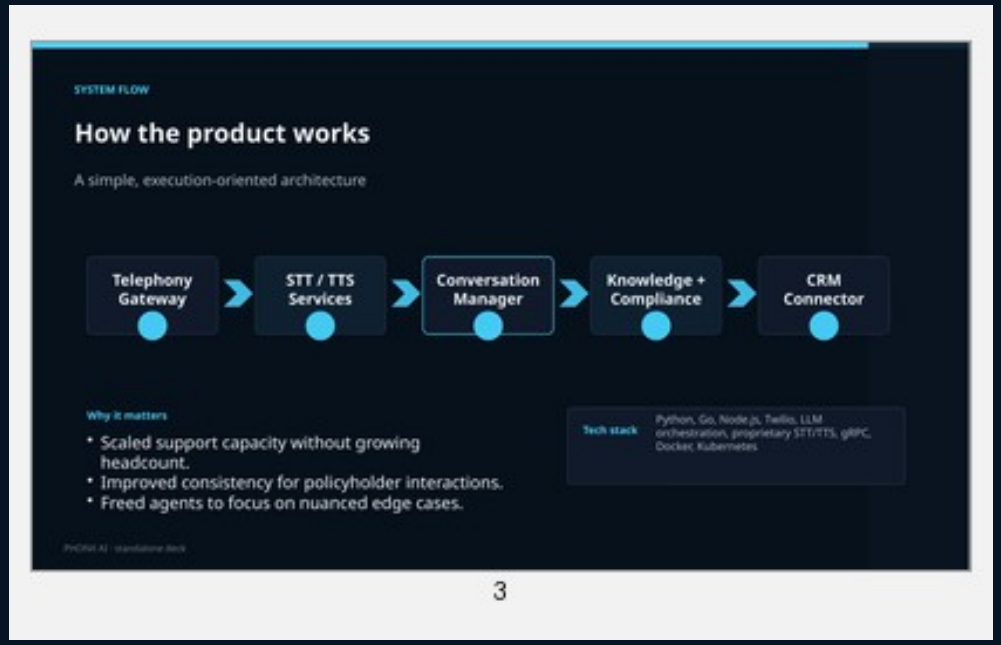

Solution view

A microservice-based voice automation system spanning telephony, speech services, reasoning, compliance enforcement, and CRM synchronization — built for sub-second, multi-turn conversations.

Telephony → STT/TTS → Conversation → Knowledge ✦ Compliance → CRM Sync

Client outcomes

- Turns phone operations into a scalable infrastructure layer.
- Creates more consistent customer experiences across every call.
- Lets human agents focus on exceptions and revenue-critical cases.

HOW TO POSITION IT

From interest to delivery

01

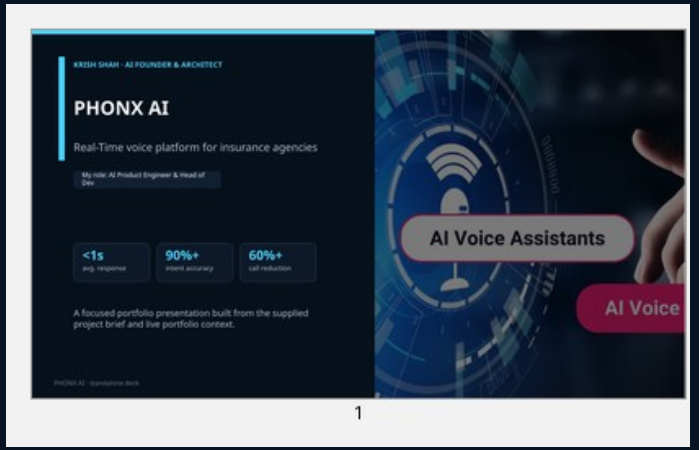

Map live call flows

02

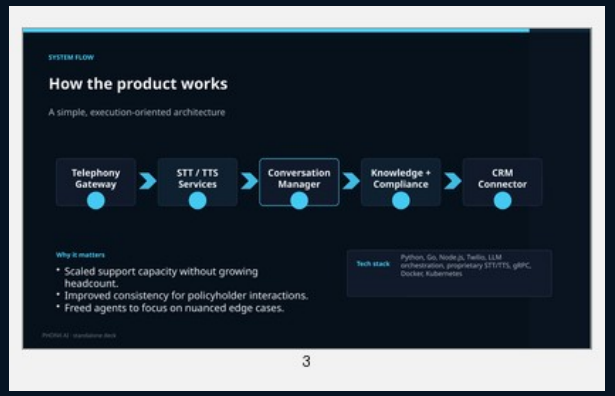

Pilot highest-volume intents

03

Roll out with CRM and compliance controls

1

3

Why this feels credible in a client conversation

- Portfolio case study positions the system around real operational constraints, not a demo.
- Metrics are framed around response time, accuracy, and reduced human call load.
- The engagement naturally maps to discovery, pilot, and production rollout.
